

Milestone 5 & 6

Milestone 5: Create the user profile interface and display its data.

It consists of 3 parts:

1. **Basic data:** We need the user to be able to see and edit their name by connecting to the '**responsible_user.name**' table with the '**id**' of the logged-in user.
 - a. Pressing the edit button should open a modal window to enter and confirm the new name.
 - b. Upon confirming the action, the success message must be shown (Reuse already created component)
 - c. The modal designed in Figma is not the final version. You must reuse the components of the modals already created in the system to ensure visual consistency.

Datos básicos

 Correo: r.tapia.jensen@gmail.com

 Nombre: Jaime Campusano 

2. **Security:** Just focus on the visual design and input states. I'll take care of connecting it to the API and Supabase later.

Seguridad

 Contraseña: ***** 

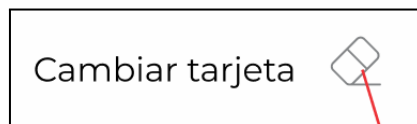

- a. Display static text that says 'Cotraseña: *****'
- b. When displaying the modal: Consider including the typical 'eye' icon on the right to toggle visibility in the 3 password fields.
- c. The modal designed in Figma is not the final version. You must reuse the components of the modals already created in the system to ensure visual consistency.

Milestone 5 & 6

3. **Subscriptions:** API call: Make a request to the following route to obtain the subscription list: `fetch('/api/subscriptions')`

- JSON structure:** Map the structure described in Figma.
- The modals designed in Figma are not the final versions. You must reuse the components of the modals already created in the system to maintain visual consistency.
- Update card button ('Cambiar tarjeta'):

- Display in a modal rendering the component: **'components/CheckoutSuscripcion.tsx'**
 - Just take care of the visual design. I'll handle connecting it to the API and Supabase later.
- d. Cancel plan button:

- Display a modal with 2 buttons.
- Just take care of the visual design. I'll handle connecting it to the API and Supabase later.

Milestone 5 & 6

Milestone 6: Create the notification interface and deploy its data.

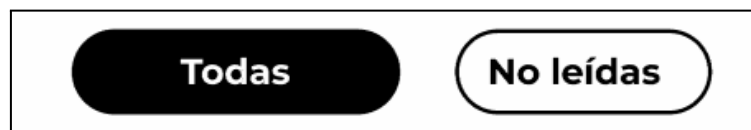

It consists of 3 parts:

1. Notifications:

- a. **JSON structure:** Map the structure described in Figma from the 'notification' table
 - i. Only show the 'notification.is_read = FALSE'
- b. If there are no notifications, display the text: "All up to date! Here you will see your upcoming challenges and alerts"
- c. The 'created_at' field should be mapped to the number of days since the current date
- d. If you click the button to display the additional information modal, you must set the status of 'notification.is_read = TRUE'

2. Notification filters: Both buttons only bring the last 10 notifications.

- a. The first button displays all of the user's notifications.
- b. The second one only sets the 'notification.is_read = FALSE'

3. Unread notification indicator:

- a. The red circle only appears when 'notification.is_read = FALSE' exists
